

I strongly support XM satellite radio and their traffic and weather broadcast service. This nationwide traffic and weather service is an important public safety tool, and a valuable personal service. This traffic and weather service is a very appropriate use of satellite radio broadcasting services.

I believe that the NAB's position opposing the satellite radio traffic and weather broadcasts is wrong, and that the NAB is acting to hurt the consumer and the national public safety. The NAB is only interested in protecting the profits of the inferior broadcasting quality of FM and AM stations. The NAB should be acting to help the terrestrial FM and AM radio stations improve their technical broadcast capabilities to improve their programming quality and value to the consumer, which could include a traffic and weather service using the digital IBOC technology.

Please support XM satellite radio and their excellent traffic and weather services. I support satellite radio broadcasting technology, and the traffic and weather services now provided.

Thnak You, Stephen Floyd
